Specialization: Data Analyst

Problem Statement: Air BNB company to working to see where their business is doing good in overall USA. They want to expand their business on this city. Last few years business data in different city are given to analysis.

Data understanding: This csv file contains lots of null values and columns which are not needed for analysis. It also got some outliers which should removes. Some null values should remove, and some should fill up with mean values. It depends on what columns, and which values we needed, and which are not.

Data type: Structured data (csv file)
