Specialization: Data Analyst

Problem Statement: Air BNB company to working to see where their business is doing good in in USA city of NYC. They want to expand their business on this city. Last few years business data in different city are given to analysis. The data is full of inconsistency, null values, and unwanted columns. Which should take care of before EDA. The focus is to see how business is doing in different city in New York.

Data understanding: Some duplicates values for customer ID given which is removed for the analysis. To work on customer satisfaction varies review column are given which will help to see customers reviews for different city. Basically here the analysis will be based on reviews columns which will help to where Air_bnb can increase there business.

Data type: Structured data (csv file)
